

<h3>Problem Solving Strategies</h3> <h4>Backtracking</h4> <ul style="list-style-type: none"> • Uses algorithms, often recursively. • Builds a solution methodically. • Based on paths which have been visited and found to be correct. • The algorithm backtracks to the previous stage if an invalid path is found. <p>Best described as an “Organised Brute Force”</p> 	<h4>Data Mining</h4> <ul style="list-style-type: none"> • Analysing/converting large quantities of data into useful information • To find patterns / trends / anomalies in data • To find information / relationships /facts not obvious to the user • These data sets are known as “big data”. • It spots correlations between data and other trends which might not be easy to see. • Can be used to make predictions about the future. • A useful tool to assist in business and marketing. 	<h4>Heuristics</h4> <ul style="list-style-type: none"> • A rule-of-thumb approach that provides an estimate. • Used to find an approximate solution to a problem. • Used when the exact/standard solution would take too long. • Does not guarantee a 100% accurate or optimal solution, but reduces the time needed to solve the problem. <p>For example: A* shortest path</p> <ul style="list-style-type: none"> • Heuristic is an estimated cost of each distance • Heuristic is added to distance to identify least cost next step • It does not revisit routes already visited • It does not visit every single possibility... • ...as it focuses on nodes that are promising • It ignores some areas to speed up finding a solution 																																																					
<h3>Performance Modelling</h3> <ul style="list-style-type: none"> • Mathematical method to test loads on systems. • A cheaper and less time consuming method of testing applications. • Used for safety critical systems where a trial run can't be carried out. 	<h4>Pipelining</h4> <ul style="list-style-type: none"> • The division of instructions into a series of steps • A different part of each series of steps for a different instruction can be run by the processor at the same time • An instruction can be fetched whilst another is decoded whilst another is executed. • use of pipelining will make more efficient use of processor because it reduces/removes latency and the CPU is not idle while waiting for next instruction. • Next instruction is fetched while current one is decoded/executed therefore more instructions executed per second • Pipelining efficiency reliant on programs (mostly) executing sequentially (efficiency reduced by jump instructions requiring pipeline to be reset) <p>Instruction 1 2 3 4</p> <table border="1"> <tr> <th></th> <th>Fetch</th> <th>Decode</th> <th>Execute</th> <th>Write</th> </tr> <tr> <th>1</th> <td>Red</td> <td>Orange</td> <td>Yellow</td> <td>Light Green</td> </tr> <tr> <th>2</th> <td>Red</td> <td>Orange</td> <td>Yellow</td> <td>Light Green</td> </tr> <tr> <th>3</th> <td>Red</td> <td>Orange</td> <td>Yellow</td> <td>Light Green</td> </tr> <tr> <th>4</th> <td>Red</td> <td>Orange</td> <td>Yellow</td> <td>Light Green</td> </tr> </table> <p>Cycles/Time →</p>		Fetch	Decode	Execute	Write	1	Red	Orange	Yellow	Light Green	2	Red	Orange	Yellow	Light Green	3	Red	Orange	Yellow	Light Green	4	Red	Orange	Yellow	Light Green	<h4>Visualisation</h4> <ul style="list-style-type: none"> • It is a graphical representation, for example presenting data using graphs. • Often using objects and symbols • Used to simplify the problem • Makes it easier for humans to understand.  <p>INTRODUCTION TO GRAPHS</p> <table border="1"> <thead> <tr> <th>Position</th> <th>Right pointer</th> <th>Name</th> <th>Left pointer</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>5</td> <td>Danube</td> <td>2</td> </tr> <tr> <td>2</td> <td>X</td> <td>Arne</td> <td>X</td> </tr> <tr> <td>3</td> <td>X</td> <td>Thames</td> <td>6</td> </tr> <tr> <td>4</td> <td>3</td> <td>Nile</td> <td>1</td> </tr> <tr> <td>5</td> <td>X</td> <td>Dee</td> <td>X</td> </tr> <tr> <td>6</td> <td>X</td> <td>Rhine</td> <td>X</td> </tr> </tbody> </table> <p>Nodes/Vertices →</p> <p>Edges →</p>	Position	Right pointer	Name	Left pointer	1	5	Danube	2	2	X	Arne	X	3	X	Thames	6	4	3	Nile	1	5	X	Dee	X	6	X	Rhine	X
